We have significant experience in the inspection and rehabilitation of material storage structures, including silos, tanks and bunkers

VISUAL INSPECTION AND SCANNING

- Visual inspection of conditions identified by the plant. When visual access is restricted due to high elevations, laser scanning is done with a drone for later modeling and desk analysis.
- Initial assessment of structurally critical areas.
- Special attention to signs of structural distress.
- Report with findings and recommendations for follow-up work.

REMEDIAL WORKS

- If the structure does not exhibit signs of structural distress, but shows significant deterioration, detailed inspections and testing are recommended.
- If the structure exhibits signs of structural distress, immediate remedial works are recommended, and a program is presented to the customer for work required.

We have developed a systematic approach which ensures the safest and most economical solution.
